

Incorporate live TV and video streams into your digital signage strategy

Keep staff and guests informed, engaged, and entertained.

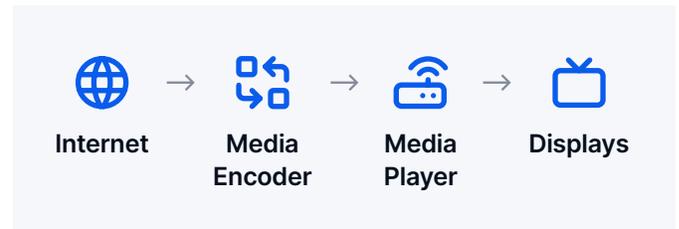

IPTV, or Internet Protocol television, allows you to broadcast live video streams to your digital signage devices via your IP network rather than traditional satellite or cable television. This content can be prioritized to take over current content and displayed full-screen. Or use a multi-zone layout which allows video streaming and other content to be viewed at the same time.

We integrate with dozens of leading providers like Vbrick, MediaStar, Haivision, and more to incorporate IPTV into your corporate communications strategy, keeping people informed, engaged, and entertained across multiple industries.

For most providers, integrating streaming content is as straightforward as entering the live video stream's source URL in a Live Channel in Appspace.

Encryption is supported through our partnerships with MediaStar and Vbrick. Our Enhanced Services team is also available to assist with streaming encrypted content from other IPTV providers.
